# Using the DOS Version of Edit with Windows XP

Windows XP does not display MS-DOS programs in a full window like the previous versions of Windows. If you are still using the DOS version of the AristoCAT Edit program under Windows XP you will probably find the Edit window will be quite small. It is possible to make the Edit window bigger, but in most cases the Edit window will still be only about two-thirds the size of the screen. The only way to have a full screen edit is to use the Windows version of the Edit program

To make the edit window larger do the following steps:

1. Open up any .WRK file in the Edit program.
2. In the upper left corner of the Edit screen you will see a small C:\ on a black background. See picture on right:

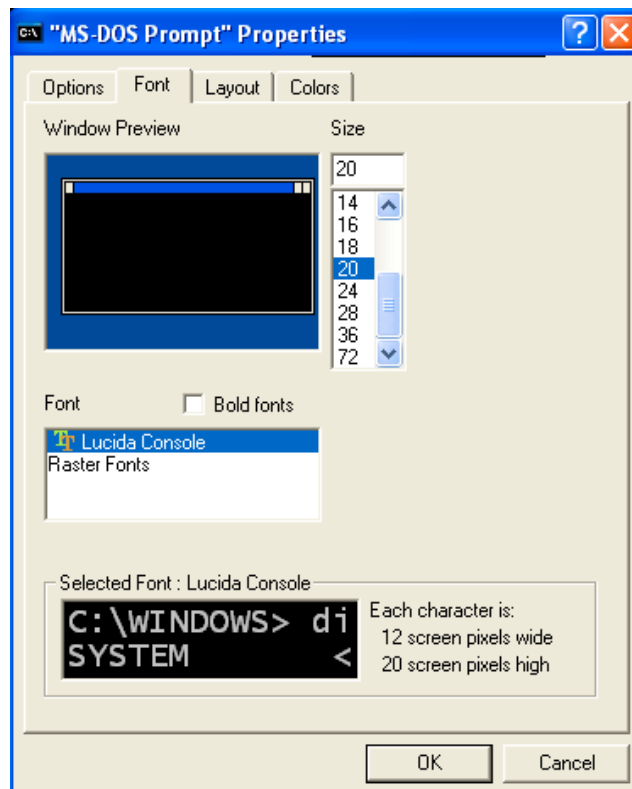

3. Right-click on the C:\ and then left-click the Properties menu item. See picture to right::
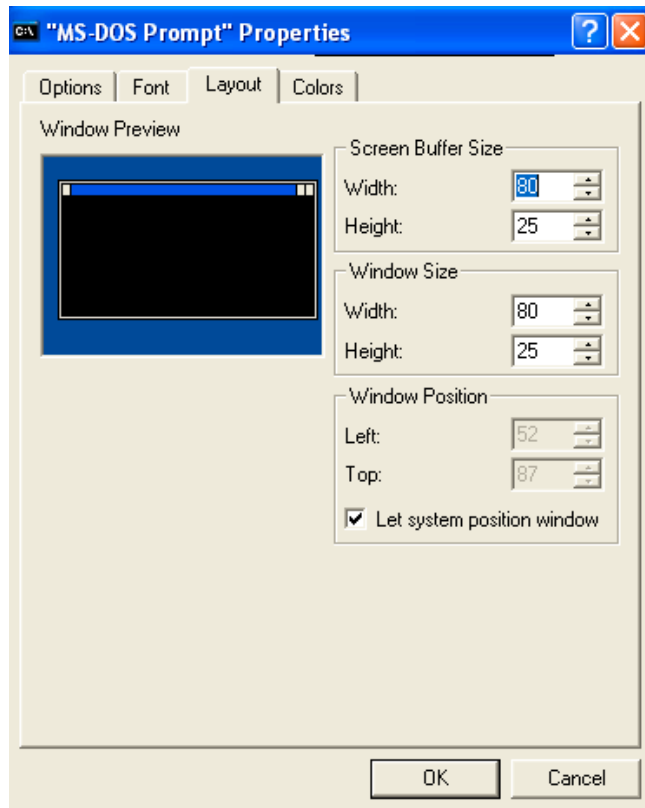

4. Left-click the Options tab at the top of the screen. Under Cursor Size left-click the Large option. See picture below:

5. Now left-click the Font tab. First under the Font option, left-click Lucida Console. Then in the Size window, left-click on 20. See picture below:

6. Now left-click the Layout tab. Make sure that both the 'Screen Buffer Size' and the 'Window Size' has the Width set to 80 and the Height set to 25. See picture below:

7. Now left-click the OK button. You will now see the following screen:

Check the 'Modify shortcut that started this window' and then left-click the OK button. Note that you only have to do these steps once. On some computers, you may be able to choose a font size larger than 20 in step 5.
